What is Computer Engineering?

Building computers, and everything that runs on them.

1 AI

Teaching machines to learn from examples, instead of telling them every rule.

Where it's used: voice assistants, medical scans, self-driving cars

2 Development

Building the apps and systems people use every day, and keeping them running.

Where it's used: social media, online banking, video games

3 How a computer works

Designing the chips and circuits that turn 0s and 1s into decisions.

Where it's used: phones, cars, robots, smart devices

Try it! Train an AI, follow a packet, or flip the switches.
